Аннотация:

The current socio-economic situation of the Russian the Federation is characterized by the presence of a number of negative nds and crisis phenomena that restrain the dynamic development and modernization of the country. These include regional differentiation and polarization, low rated of economic growth and incomes of the population, inadequate development of the market and social infrastructure, low investment activity, etc. All of these problems can not be effectiyely soled only at the federal level, an important role is assigned to the authorities of the constituent entities of the Russian Federation. It is in the regions that the economic, innovative, and human potential is created and reproduced. All this underlies the releance of an effectiely functioning system of regional governance.Overcoming the crisis in the country and its individual territories is imossible without eliminating the existing shortcomings and inconsistencies in the management system itself, manifested in the established sectoral approach to the formation of regional authorities, duplication of their management functians at hierarchical levels and ineffective interaction between them, insufficient competence of management personnel and, in general, the lack of a clear understanding of the functioning of the governancemechanism in federal districts. The aim of the work is to study and develop methodological and practical recommendations for improving the management of the socio-economic development of the region using the tools of analysis and forecasting.
