Аннотация:

The article covers the issues of the essence of the “energy saving” concept, the development of scientific foundations for improving the efficiency of energy saving processes management at industrial enterprises. The work analyses the problems concerning the essence of energy saving management, methodological approaches and basic requirements to energy saving management, tasks, and stages of energy saving management implementation. It was concluded that the transition to the efficient use of energy resources, which will correspond to the indicators of the city economy and industrial enterprises of the world's leading countries, is possible only through an integrated approach based on the targeted management of energy saving processes.
