Аннотация:

Economic sanctions as well as geopolitical situation have set new challenges for Russia. They reflect the necessity of creating an economy that is resistant to both the impact of external, often negative factors, and the need to reformat domestic economic policies. The article deals with the features of the interconnection of the industrial region energy sector and the sustainability of its development. It emphasizes the fact that in the context of an economic crisis the adaptation of regions to new economic conditions is actively influenced by internal factors. The fuel and energy complex is becoming one of the leading domestic resources as well as a catalyst for the related industries. It is noted that unsustainable processes of activating internal regional resources (energy, finance, etc.) hinder achieving sustainable development of the economy.
