Аннотация:

Today the issues of overcoming the environmental consequences of the negative structural shift of the Russian economy, accelerating the rate of economic growth, reducing the technological and social-and-economic separation from developed countries are becoming strategically in demand for extractive clusters. The need for methodological and theoretical support of the neo-industrialization of the Russian economy raises the urgency of analyzing ways to solve environmental problems, relying on reducing the share of raw materials production in the gross regional product. The emergence of an innovative paradigm raises environmental requirements for industry, raises the priority of interaction institutions between the state, science and business in the process of reducing environmental damage. The leading role is played by the analysis of innovative nature protection activities in extractive clusters and structuring the competitive advantages of the economy, not related to the export of raw materials.
