Аннотация:

The mechanisms for implementing local government have not been developed in Russia. This leads to the fact that the activities of the authorities are now ineffective. The relevance of the study is to develop models that improve the system of municipal government. The authors put forward a number of hypotheses using the benchmarking method and analysis of the world practice of organizing municipal government in developing the theoretical model "3-p". The authors carried out a sociological research to test the developed theoretical model. This allowed to improve the elements of "3-p", eliminating unconfirmed hypotheses and adding the identified important components. The model created by the authors is a self-organized system, it has feedbacks, it is possible to increase the flow of resources and obtain a synergistic effect. © 2018 Mykolas Riomeris University.
